MULTI-CAPABILITY DISPLAY

Abstract of the Disclosure

[0070]   ·An image is generated using two or more projectors, at least one of which displays the main display area and at least one of which is pointed and zoomed so as to display one or more windows in a region within the main display area. Windows are displayed at a higher resolution than the main display area, and/or including additional display capability or characteristics beyond those of the main display area. Windows are movable and resizable according to known techniques of window manipulation in conventional graphical user interfaces. A control mechanism associated with each window projector moves and resizes the displayed images generated by window projectors in response to such window manipulation.
